

READY TO RESTORE

ONSITE MANAGED BACKUP VAULT

Our ready to restore onsite vault is a physical backup device that resides at your premises and allows for near-instant data restoration. This makes it ideal for businesses with strict recovery-time objectives and those who cannot afford any downtime.

The onsite vault

The ready to restore vault is installed on your premises, but is owned and wholly managed by GCOMM. You will be provided with one vault for each of your locations. The vault allows for high speed backups and near-instant data restoration, keeping your business running smoothly.

Backup and restore at LAN speeds

Data from your servers is collected by the onsite vault. At the same time, your backups are also replicated to our remote backup locations. If data restoration is ever required, files can be quickly and easily restored from the local environment at LAN speeds.

For businesses with high RTO

The onsite backup vault is ideal for businesses that require frequent backups and speedy data restoration. With our ready to restore vault your critical data resides locally, encrypted and compressed, allowing for seamless business continuity.

Flexible storage

Our backup service can be scaled up or down and our onsite vaults provide you with various storage capacities, ranging from 250 GB to 10 TB of data.

High RPO for less

Keep as many versions of your backup locally as you wish and roll back or restore data to any point in time. As your data resides locally, there are no bandwidth costs.

Cloud to premise backup

If you have data residing in the public cloud, you can back it up directly to your premises by deploying an onsite vault at your office. This provides you with a local copy of your data in case your cloud provider goes offline or is unavailable for an extended period of time.
